Susie Meyer meets PL/I

The story of how a single language answers the question, "Can a young girl with no previous programming experience handle both commercial and scientific applications, without resorting to an assembler language?"

Let's face it. The end of programming just keeps going up. In the next ten years, how will it be to the year 2000, and how will the Susie Meyers of those years be treated?

The answer for PL/I is the high-level language for both scientific and commercial applications.

With PL/I programmers don't have to learn other high-level languages. They can concentrate on 360-800 on the language.

So think about PL/I. Not just in terms of teaching, but in terms of the total impact it can have on your operation.
