We've Changed For The Better To Help You Better With Change

We are now a part of Gulton Industries — with the resource strength for accelerating Grinnell’s capabilities in the manufacture of image processing and graphic display systems, assuring our customers of continued leading-edge technology and solid support services.

The ebb and flow of fast moving technology can make hardware selection a costly, high risk business. That's why Grinnell has committed to an ambitious customer support program in image processing and graphic display systems, which already includes several new regional centers to conveniently help you along the selection process.

So, whether your system's application calls for medical imaging, simulation, graphic arts or non-destructive testing, to name a few, depend on Grinnell to be there for the best way to solve it.

Choose from the industry's widest range of graphics display and image processing systems from the company that started it all

Grinnell was there in 1975 at the start of making complex data visually meaningful. Today we offer systems from 256x512 to 1024x1280 resolution. And there are many different imaging systems from which you may choose — or customize — to fit special requirements.

Our systems are designed to simplify the hardware to software interface

OEMs often have a tough job of integrating with another company's system. Grinnell took note of that long ago and did something about it through an intelligent interface. It allows you to integrate our...
processor to your special application; and, still process with exceptional speed and flexibility that is remarkably free from external limitations.

**We help you program smarter, with built-in intelligence**

Helping you easily weather change is the goal of our software packages, designed to simplify your programming task. Take our advanced, Writeable Control Store (WCS): It enables experienced programmers to easily personalize otherwise time consuming and cumbersome coding procedures. That means you can experiment or fine tune, and run specialized applications in a fraction of the time it might usually take.

**Modular systems let you choose exactly what you need**

Because Grinnell systems are so modular, we can help you “design” your own system. You can specify various combinations of graphic resolution, speed, video processing and manipulation features as well as many others. And, naturally, we’re here to help you with your system definition, so that it not only matches your budget, but also your application.

**Grinnell works with you for the right solution now and later**

The “Grinnell Solution” means you receive exactly the right answer for your requirement from a company that covers more application areas than anyone else in the image processing and graphics display industry. That’s a lot of ground. But more importantly, it means that we’ve seen and solved more problems than anyone else, with the great likelihood we will have a good understanding of solutions that will work for you not just today, but years from now as well.

**We stay with you, providing installation, training, plus continuing technical assistance whenever you require it**

Grinnell/Gulton is a global company with a growing service and support organization. And as good as Grinnell was, we are in the process of getting better. That’s our commitment: We’ve changed. To help you better with change.
