Peter S. Walker is the director of the Orthopedic Biomechanics Lab of Brigham and Women's Hospital and the VA Medical Center. He is also an associate professor of Harvard Medical School. He received his PhD in mechanical engineering and medicine from the University of Leeds in England. His interests include design and evaluation of orthopedic implants and devices, the biomechanics of joints and of the musculoskeletal system, and the properties of biological and artificial biomaterials. Using computer graphics techniques, he has developed the Kinematic Total Knee and, more recently, the Profile Total Hip.

Walker is an associate member of the American Academy of Orthopedics. He also holds membership in the Knee Society, the Hip Society, the Orthopaedic Research Society, ASME, and other organizations related to his field of interest.

Philip C. Nelson received his SB in computer science from MIT in June 1985. Part of this article was included in his dissertation, for which he received a second place award for best undergraduate thesis. Nelson now works as a computer scientist with Advance Decision Systems, Mountain View, California, a company that specializes in contract research in artificial intelligence. His recent projects include a pilot's associate prototype, an image understanding system for autonomous navigation, and a distributed implementation of propositional and predicate calculus based on the laws of form. Nelson is a member of AAAI and IEEE.
