PRINCIPLES OF DATA SECURITY
by Ernst L. Leiss, University of Houston

The protection of data, especially in the extensively shared and distributed commercial systems, is a vital issue in computer science. This volume presents an integrated approach to the fundamental technical problems of developing and implementing data security. Topics include:

- how to preserve the security of statistical databases where access to statistical information about confidential data items is to be allowed
- inexpensive methods that guarantee the security of the underlying database in databases where queries are key specified
- the inherent safety problems of authorization systems
- the dilemma of user's rights and limitations on access to certain data
- employing digital signatures in the authentication of data requests
- applications of cryptography in the protection of software against theft

COMPUTER NETWORK ARCHITECTURES AND PROTOCOLS
edited by Paul E. Green, Jr., IBM Research Center, Yorktown Heights, N. Y.

"...will become the classic reference work in the field of computer communications. From some of the top researchers in the field; the editor has collected a comprehensive set of essays that deal with all aspects of computer networks."

Choice: Information Science

"The book is a significant contribution to the literature. It is authoritative, complete and accurate...Dr. Green and the authors have taken considerable trouble to make the material accessible to a wide audience."

Jeremiah F. Hayes, McGill University

OFFICE AUTOMATION
A User-Driven Method
by Don Tapscott, Trigon Systems Group, Toronto, Canada

A careful analysis of the problems of integrating the needs of office workers with the design of the office of the future. The author's "user-driven method" of integration helps the users of modern office technology adapt new systems to their particular requirements. A volume in Applications of Modern Technology in Business. E. K. Clemons, Consulting Editor.
