TABLES OF CONTENTS

Utilizing Computer Graphics
Interactive Recognition of Hand-printed Characters for Computer Input Jeanne Ward and Barry Blessing
With all the variations found in people’s handwriting, can any input device read everything correctly?

Stereo and Alternating-Pair Techniques for Display of Computer-Generated Images Harvey F. Hodge and David F. McAllister
Electro-optical stereo pair displays and alternating-pair displays are both viable methods for true 3-D representation of computer-generated images.

Article
The Beta2-Spline: A Special Case of the Beta-Spline Curve and Surface Representation Brian A. Barsky and Tony D. DeRose
Simpler equations and computationally more efficient algorithms make the Beta2-spline technique easier to understand and useful to the designer.

A Performance Study of Mutual Exclusion/Synchronization Mechanisms in an IEEE 768 Bus Multiprocessor E. Pearce O'Grady and Raul Lucano
Of three mechanisms evaluated, the FIFO semaphore tied up the system bus the least.

A Real-Time Fortran Executive Daniel A. Crowl
This executive provides its users with sophisticated real-time functions without requiring them to do a lot of complicated assembly language interfacing.

Mapping High-Level Syntax and Structure into Assembly Language M. F. Smith, Y. Hoffner, and M. A. Seidler
Does the mapping of mnemonics into high-level notation make assemblers easier to use? The authors’ experience suggests that it does not.

The Theory and Practice of Functional Testing William E. Howden
Viewing programs as syntheses of requirements, design, and programming functions allows programmers to address a wide variety of errors—even subtle and difficult-to-find missing code faults.

Practical Priorities in System Testing Nathan H. Petschenik
During the system test phase, “thorough testing” can pass the limits of practicality. Test case selection, based on simple priority rules, is one solution to the problem of practicality vs. thoroughness.

The Larch Family of Specification Languages John V. Guttag and Jeannette M. Wing
Larch specifications are two-tiered. Each one has a component written in an algebraic language and another tailored to a programming language.

Large Software Problems for Small Computers: An Example from Medical Imaging Gideon Frieder, Gabor T. Herman, Craig Meyer, and Jayaram Udupa
Small computers can be called on to perform large tasks. Doing so requires careful organization of input, output, auxiliary data structures, and memory.

Who Owns What Software Produces? Michael C. Gerrymander
When programs rather than humans create products, the issues of product ownership create thorny legal problems which the law has yet to address.

Logic Programming and Prolog: A Tutorial Ruth E. Davis
Logic programming offers significant advantages for the massively parallel computer systems of tomorrow. This tutorial examines the potential of Prolog to implement those advantages.

Fault-Tolerant Routing in DeBruijn Communication Networks A.-H. Esfahanian and S. L. Hakimi

High-Speed VLSI Multiplication Algorithm with a Redundant Binary Addition Tree N. Takagi, H. Yasuura, and S. Yajima

Encryption and Error-Correction Coding Using D Sequences S. C. Kak

Concurrent Fault Detection in Microprogrammed Control Units V. S. Iyer and L. L. Kinney

Efficient Storage Management for Temporary Values in Concurrent Programming Languages D. Quaasen, J. P. Kearns, and M. L. Sojka
