February 1987

Volume 20, Number 2

ARTICLES

14 Guest Editors' Introduction: The Federal Aviation Administration's Advanced Automation Program
Valerio R. Hunt and Gregory V. Kloster
Engineering the world's largest command and control system, this issue communicates the authors' experiences in the design of the next-generation air traffic control system.

19 The FAA's Advanced Automation System: Strategies for Future Air Traffic Control Systems
Valerio R. Hunt and Andres Zellweger
The FAA's new-technology air traffic control computer system will lead to highly automated air traffic control by the turn of the century.

33 Evaluating Proposed Architectures for the FAA's Advanced Automation System
Jean-Marc Garoli, Delbert Weathers, and Thomas Hawker
Complex system-architecture evaluation is a business fraught with many perils. The FAA seeks to minimize these perils by pursuing a broad range of architectural analyses.

47 Engineering the Man-Machine Interface for Air Traffic Control
Gregory V. Kloster and Andres Zellweger
Commitment to MMI concerns is an integral part of the FAA's Advanced Automation Program. From day one the controller has been an active participant in a rigorous MMI design process.

63 The Quantification of Operational Suitability
Mark D. Phillips
A team of air traffic controllers has participated in a structured requirements engineering and design evaluation process to help develop the Advanced Automation System computer-human interface.

73 Capacity Management of Air Traffic Control Computer Systems
Sandra Bleistein, Robert Goetge, Frank Petroski, and Robert Wiseman
Detailed workload specification, extensive response time requirements, and precise modeling of software behavior characterize capacity management of these complex, embedded computer systems.

84 On the Achievement of a Highly Dependable and Fault-Tolerant Air Traffic Control System
Algirdas Avizienis and Danforth E. Ball
Can we trust the new AAS to deliver highly dependable air traffic control service until the year 2000? Yes, systematic application of fault tolerance offers a solid promise of success.

Special Feature

93 Modeling and Managing CAD Databases
Mohammad A. Ketabchi and Valdis Berzins
Although designers rarely pay much attention to data management, an effective DBMS—one that meets the modeling requirements of the design process—could increase their productivity.
6 Letters to the Editor:
SDI "red herrings"?

103 Book Reviews:
Readings in Medical Artificial Intelligence

104 Open Channel:
Artificial intelligence: Fact or fiction?
ANSI Committee LY-2299-BS

106 Update:
CS calls for nominees, issues election timetable;
CS members to fellow grade sought; CS members named fellows

On the Cover
Air traffic control involves communication between controllers and aircraft. The cover design underlines the importance of the human-machine interaction in this process. Cover illustration: Steven Hunt. Aircraft special effects: Larry Keiser.

In the next issue
Scientific computers and computer architectures
