Fault tolerance

The fault-tolerant architecture must be chosen on the basis of dependability goals for a specific plant. Such goals are difficult to define, and they often result from experience with several installations. Beyond reliability figures, what matters is the reliance of the customer on its control system. This confidence can be gained only through years of experience, reference installations, and trust in the manufacturer.

References

Hubert D. Kirrmann is a research engineer at the Brown Boveri Research Center in Baden, Switzerland. He taught for several years at the District University of Bogota, Colombia, and he has worked as an R&D engineer in the field of transducers. He is currently involved in a multiprocessor project for process control and in computer bus standardization activities. His research interests include computer architecture and fault-tolerant systems.

A member of the IEEE, the ACM, and EWICS, Kirrmann received MS and PhD degrees in electrical engineering from the Swiss Federal Institute of Technology, Zurich, in 1970 and 1986 respectively.

Kirrmann's address is Brown Boveri Research Center, CH-5405 Baden-Dättwil, Switzerland.
