The Twenty-First Century Overture

Where will time take us next?

To an information utopia where knowledge belongs to everyone? To an age when the computer becomes one with communications and thought travels everywhere, anywhere and at anytime? To a brave new world where electronic intuition solves the impossible problems that have followed us through history?

Getting to this future first is our mission.

We’re Bell Communications Research (Bellecore), established as the central source for the research and technologies that will enable the Bell Operating Companies to design this different time.

We are working in areas that include software development; applied research; information systems; systems engineering; network planning services; and equipment assessment.

Our purpose is to know more, understand more, see more so that we can provide others with the expert advice they need in many different technical and scientific areas. Our mandate is to provide the BOCs with the software and technologies that the future will require.

We are a ‘brain trust’ that imagines a new tomorrow.

We have opportunities at our northern and central New Jersey locations for individuals with PhD, MS or BS degrees in Electrical Engineering, Computer Science, Mathematics, Operations Research, or Physics.

We’ll equipped to write the next movement in a new world symphony; we provide an environment where individual creativity and skill are nurtured and recognized.

If you want to write the technological harmonies that the future will play, contact: Manager, Technical Employment, Bell Communications Research, RRC, Department 361/3545/85, CN 1800, Piscataway, New Jersey 08854.

An equal opportunity employer

Bell Communications Research

Because the mind must meet the future
