Message from the IWSMA 2016
Workshop Organizers

Since the advent of Smartphones, mobile applications have been one of the most thriving areas in the last few years. Thus, securing mobile applications as well as protecting private user data has to be considered as key research topics in the realm of security research.

The International Workshop on Security of Mobile Applications (co-located with the ARES-conference) focuses on bringing together researchers from all over the world to share their experience and present recent research, as well as strives to initiate discussions regarding future research topics. The main focus of this year’s installment of IWSMA lies in the areas of App-Security and security issues in the usage of mobile devices as sensors and remote control for smart systems in home automation.

The papers that were selected for this workshop cover several interesting topics in this big area, thus they should give an ideal starting point for further discussion, which we are looking forward to participate in, together with the authors and an active audience. Further interaction will be triggered by the panel discussion on “Future of mobile integration into daily lives – Threats and Chances for Security”, where we all the authors are invited to talk with selected guests.
