Message from the International Workshop on Future Information System Technologies and Applications (FISTA 2011) Chairs

The advances and developments in information computing systems are fast growing towards more complex, heterogeneous, dynamically scalable, ubiquitous, autonomic, and trustworthy computing systems. The fast developing cloud computing technology as an abstraction of concealed complex infrastructure of virtualized resources and provided as web services, has spurred the grand challenges in computing.

The aim of the workshop is to provide a venue of scientific interaction of grand challenging research areas of and development of emerging and future platforms of complex network computing system technologies and applications.
