Preface

The MediVis conference has evolved rapidly from its original concentration purely on medical visualisation and is now possibly the leading interdisciplinary forum for researchers and professionals in the bio-medical domain to exchange ideas and report results on visualisation within their disciplines to the wider world. It thus provides important support for researchers who are faced increasingly with the necessity of adopting a multidisciplinary approach to address the problems faced in pushing forward the boundaries of modern medicine and biomedical disciplines.

The theme for this year’s conference is “Medical Image Registration, Bio-Medical Visualisation Techniques, and Computer Graphics applications in Medical imaging”. Of particular interest is not only the capture of visual data but the use of visualisation in post-processing to aid diagnosis.
