Plate 1: Volume rendering of the flowfield around an aircraft wing.

Plate 2: Close-up view of the wing region. Feature lines assist in relating the volume data to the underlying structure.
Plate 3: Execution time components for 64 processors; buffer depth = 25, polling after each cell.

Plate 4: Execution time components for 64 processors; buffer depth = 200, polling after every 4th cell.

A Scalable Parallel Cell-Projection Volume Rendering Algorithm for Three-Dimensional Unstructured Data
