Keynote Speaker
Toward Open-World Software: Issue and Challenges

Luciano Baresi, Politecnico di Milano

Elisabetta Di Nitto, Politecnico di Milano

Carlo Ghezzi, Politecnico di Milano

Abstract

Traditional software development is based on the closed-world assumption that the boundary between system and environment is known and unchanging. However, this assumption no longer works within today’s unpredictable open-world settings, which demands techniques that let software react to changes by self-organizing its structure and self-adapting its behavior.
