Software Product Lines

Jan Bosch
University of Karlskrona/Ronneby, Sweden

One can identify two important developments in software architecture, i.e. software product lines and software architecture design. The notion of software product lines and the process, technology, business and organizational issues of adopting the approach are presented. The material is extensively illustrated by examples and experiences from numerous industrial cases. The tutorial is based on a forthcoming book (tentative publication date: early June 2000) authored by the presenter and published by Addison-Wesley. (There is a companion tutorial on Software Architectures).
