Strategic IT Management

Per Grape

System development is both easier and harder than ever. Tools keep getting better and better, but systems are more complex than before. Strategic management of IT is a must to handle the increasing speed of change. No matter if you are in old business or new business, if you don’t have a flexible IT strategy chances are that you will run into problems. In this tutorial we will take a look at the interplay of the parts of a strategic IT management plan: architecture, integration, and long term planning. We will also look at some case studies illustrating these problems, both from an old business and a new business perspective. This tutorial is intended for people responsible for, developing or implementing IT strategies.

Per Grape is working at Adcore as Senior Consultant and Competence Coach. He has done many assignments as an advisor within systems- and IT architecture to help clients gain the full potential from the technical evolution. As a Competence Coach for System Architecture he is responsible for developing the area within the company. Per Grape has been working with system development and as a consultant for 10+ years.
