Message from the Workshop Organizers

NETSAP 2013

We would welcome you to the 4th IEEE International Workshop on Network Technologies for Security, Administration and Protection (NETSAP), associated with the IEEE International Computer Software and Applications Conference, COMPSAC, held in Kyoto, Japan. This workshop aims to discuss and advance research and development of practical systems to fight against cyber attacks. In this year, we have accepted 4 papers out of 7 submitted ones based on the careful reviews performed by the Program Committee members. The accepted papers range over topics related to development of practical systems and methodologies including measurement and analysis of real traffic, IP traceback technique and countermeasure against DDoS attack as well as vulnerability assessment.

We would appreciate all the authors who submitted papers to NETSAP 2013, and look forward to an even larger selection base in the following years. We also thank the members of the Program Committee, for their careful reviews of the submissions. The whole process supporting the workshop benefited from the COMPSAC 2013 framework, developed by the organization and steering committees of COMPSAC 2013, deployed and maintained by a valuable group of volunteers. We are grateful for their continuous assistance.

We look forward to having fruitful discussions with researchers from different disciplines in academia and industry, as well as practitioners, who share interests in countermeasures against cyber attacks.
