Foreword

The Mexican International Conference on Computer Science (ENC) is one of the most important scientific actions of the Mexican Society on Computer Science (SMCC) in collaboration with several academic institutions and research centres. ENC promotes the publication of scientific results of the international community related to applied and fundamental research on Computer Science.

The conference was held at the Tecnológico de Monterrey, campus Ciudad de Mexico, Mexico. French poet André Breton famously called Mexico the surrealist country par excellence, and Mexico City, the capital seems to revel in its strangeness. The world’s third largest urban area (by some estimates) fills a highland basin 2240 mts. above the sea level, so you might already feel a bit light-headed upon arrival. The city impresses visitors as a wonderfully weird and welcoming world, and captivates them with its year-round spring-like climate, bubbling street life and abundant cultural offerings.

The 10th edition of ENC aimed at providing an international forum for presenting and discussing advances and new research challenges in Computer Science, strengthening the sense of international community of young and senior researchers and practitioners in Mexico as host country. The quality of the conference this year was ensured by an international technical program committee. The selection of paper followed a strict refereeing process by a renowned international committee.

In addition to research papers, ENC open a space for rich discussions, panels, plenary lectures, workshops and tutorials given by international lecturers and instructors. We also had five internationally scholars as keynote speakers.

Let the work and effort of the scientific community open new perspectives for the next years of Computer Science in Mexico!

Rafael Lozano Espinosa
ENC’09 General Chair

Genoveva Vargas-Solar
SMCC President
